Background

ACADL(Long-chain specific acyl-CoA dehydrogenase, mitochondrial) is also named as LCAD and belongs to the acyl-CoA dehydrogenase family.It catalyzes the first reaction of the mitochondrial β-oxidation of fatty acids and is synthesized in the cytosol as a precursor that is larger than its mature form. The size difference between the precursor and mature rat LCAD has been estimated to be 3 kDa on the basis of SDS-PAGE(PMID:1774065).Defects in ACADL are a cause of acyl-CoA dehydrogenase very long-chain deficiency(ACADVLVD).
